

## Program 1

### LAB WEEK 1

To demonstrate the transmission of a simple PDU between 2 devices connected using a Hub and a Switch.

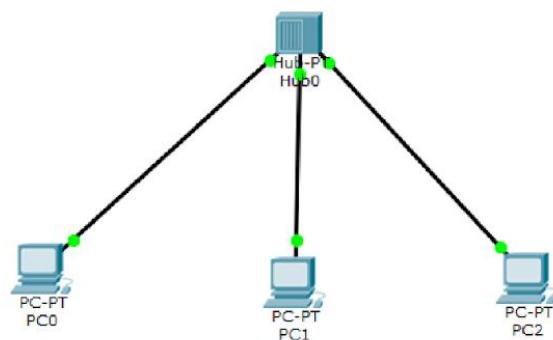

Figure 1: Using Hub

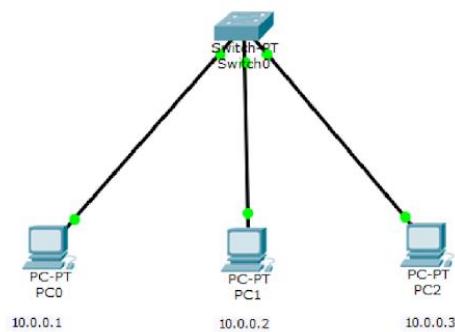

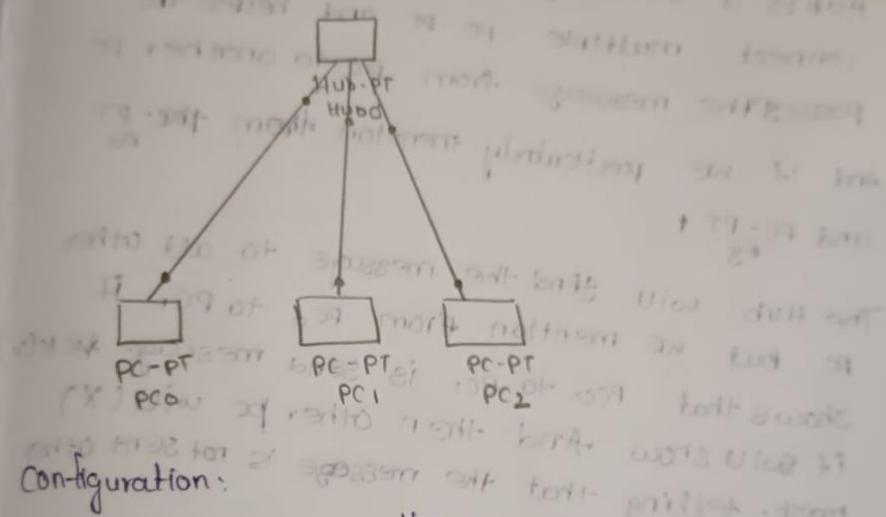

Figure 2: Using Switch

11/10/24 CN LAB

Aim: To demonstrate the transmission of a single PDU between 3 devices connected using a hub and a switch.

Topology: Star Topology.

Configuration:

1. First we select the three  $PC_0$ ,  $PC_1$  and  $PC_2$  and place above.
2. After we selected one hub and placed above.
3. And we connected through Automatically choose connection type from each PC to Hub.
4. from each PC to Hub.
5. And we select the  $PC_0$  and assign the IP address to  $PC_0$  IP Address 10.0.0.3 and click Subnet Mask 255.0.0.0 and close the IP address.
6. And we place the cursor on the  $PC_0$  IP and will show that  $PC-PT$  is connected and

5. And given PDU to the PC-PT and PC-PT  
 and stimulator mode after connected and click  
 on auto capture play to observe the transmission  
 of single PDU b/w two devices is connected.

Observation:

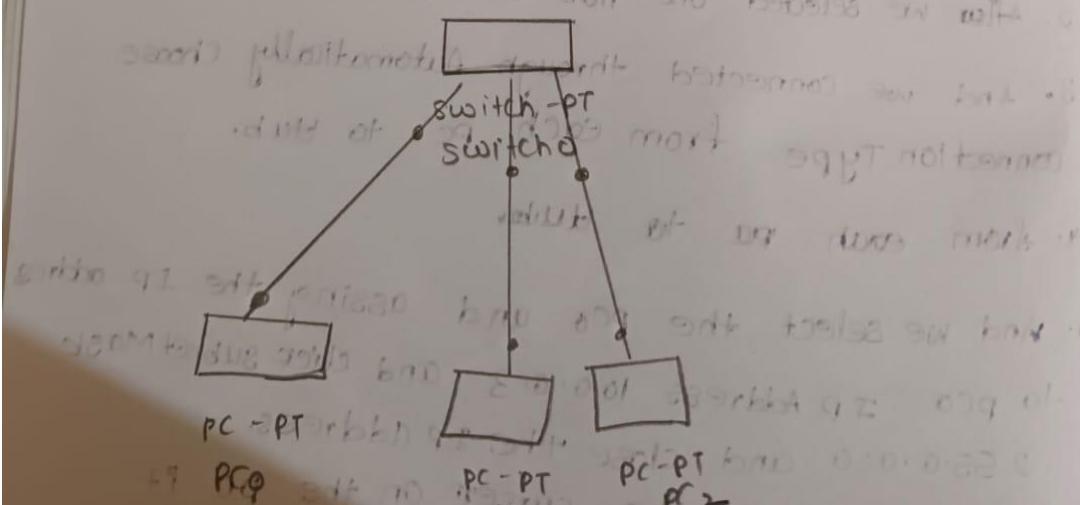

Hub is a unintelligent devices that helps us to connect multiple PC-PT and helps to pass the message from PC to another PC.

And if we particularly mention them PC-PT  
 and PC-PT +

The hub will send the message to all other PC but we mention from PC<sub>0</sub> to PC<sub>1</sub>, it shows that PC<sub>0</sub> to PC<sub>1</sub> is send message tick(Y) if you show and then other PC will(X) mark, telling that the message is not sent other

PC. T9-39 690 T9-39 79-09 99 tools on t9-77-09  
 29 109 009

Topology: Star topology:

Observation:

Instead As we see before we used the switch hub  
And now we used switch here the configuration  
will be same

But here when we used switch it send the  
message to the PC<sub>1</sub> to PC<sub>2</sub> not to other

PC.

~~start broadcast if (ifaces) reduced  
of transmission.~~

~~8/11/29~~

## Program 2

### LAB WEEK 2

- i) To demonstrate configuration of IP addresses to the Routers and explore ping command.

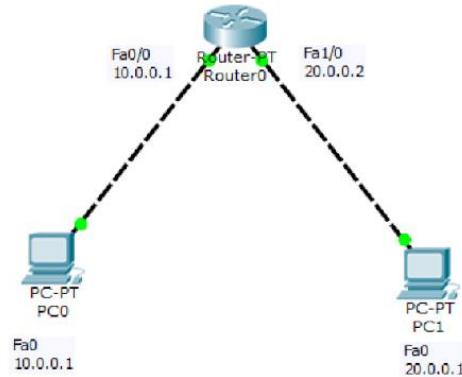

Figure 1: Topology

A screenshot of a "Command Prompt" window titled "Command Prompt". The window displays the output of a ping command. The user enters "PC>ping 10.0.0.2" and receives a response indicating four requests timed out. Then, the user runs another ping command to the same destination, receiving four replies from the target IP. The output is as follows:

```
Packet Tracer PC Command Line 1.0
PC>ping 10.0.0.2

Pinging 10.0.0.2 with 32 bytes of data:
Request timed out.
Request timed out.
Request timed out.
Request timed out.

Ping statistics for 10.0.0.2:
  Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),
PC>ping 10.0.0.2

Pinging 10.0.0.2 with 32 bytes of data:
Reply from 10.0.0.2: bytes=32 time=0ms TTL=255

Ping statistics for 10.0.0.2:
  Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
  Approximate round trip times in milli-seconds:
    Minimum = 0ms, Maximum = 0ms, Average = 0ms

PC>
```

Figure 2: ping command output

8/10/24  
LAB 2

### Experiment - 2

To demonstrate configuration of ip address to the routers and explore the ping command.

Router>enable  
Router# Router>enable

Router# Router# Router>config t

1) Enter

2) enable

3) config t

4) interface fastethernet0/0

5) ip address 10.0.0.2 255.0.0.0

6) no shutdown.

Enter configuration commands, one per line

End with ENTR

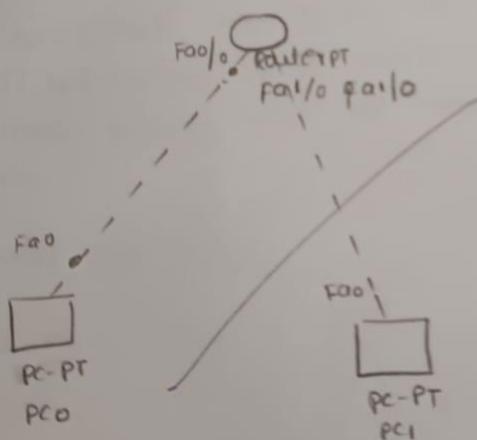

Router(config)# interface faste

fastethernet0/0

Router(config-if)# ip address 10.0.0.2 255.0.0.0

configuration:

Topology:

configuration:

1) Select the generic pc-PT PC0 and PC1

2) And take one generic router and the pc-PT PC0 and Router PT through automatically choose connection type through connection.

3) Then give the ipaddress for PC-PT is 10.0.0.1  
PC0

and give

20.0.0.2

4) And select

first then Gair P

1) enter

2) enable

3) config

4) interfa

5) ip add

in th

6) same

7) The

prompt

writ

ping S

③ And give the ip address different for PC-PT is  
PC<sub>1</sub>  
10.0.0.2

v) And select Router select CLI (command line interface)

then First press Enter and write commands

1) Enter

2) Enable

3) config

4) interface fastethernet 0/0

5) ip address Here the ip address for fasternet 0/0  
should give the different number at last digit  
of PC-PT means here 10.0.0.2

6) shut down. then red signals turn to Green

after that give the exit  
start doing 3) command for Fastether net 1/0.

10.0.0.2. same steps.

6) And after select PC and select config  
then give the ~~Gateway~~ address as given  
in the FAO. 10.0.0.2

7) Same for PC-PT PC<sub>1</sub> 10.0.0.2.

8) Then go to desktop and select command  
prompt

write ping write destination address of 10.0.0.2

Ping statistics for 10.0.0.2:

packets: sent = 4 , received = 4 , lost = 0 (0% loss),

observation:

After typing the ping command in the command

prompt

ping 20.0.0.2

Pinging 20.0.0.2 with 32 bytes of data:

Reply from 20.0.0.2: byte=32 time=0ms TTL=255

Ping statistics for 20.0.0.2:

packets: sent=4, received=4, lost=0 (0% loss),

approximate round trip times in milliseconds:

Minimum=0ms, Maximum=0ms, Average=0ms

Minimum=0ms, Maximum=0ms, Average=0ms

Here the from source to destined it received at

minimum=0ms, maximum=0ms, average=0ms

### Program 3

#### LAB WEEK 3

To demonstrate configuration of default and static routes through a connection of routers.

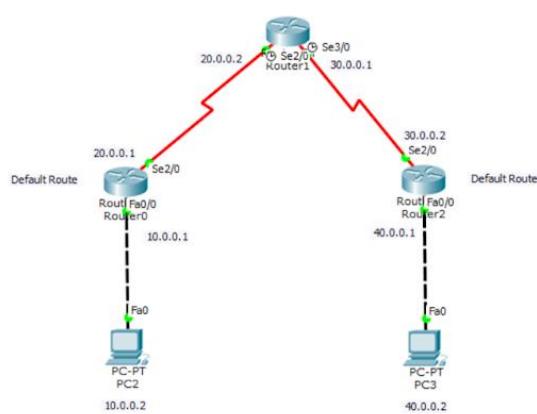

Figure 1: Topology

#### Command Prompt

```
PC>ping 40.0.0.2
Pinging 40.0.0.2 with 32 bytes of data:
Reply from 40.0.0.2: bytes=32 time=21ms TTL=123
Reply from 40.0.0.2: bytes=32 time=16ms TTL=123
Reply from 40.0.0.2: bytes=32 time=9ms TTL=123
Reply from 40.0.0.2: bytes=32 time=9ms TTL=123

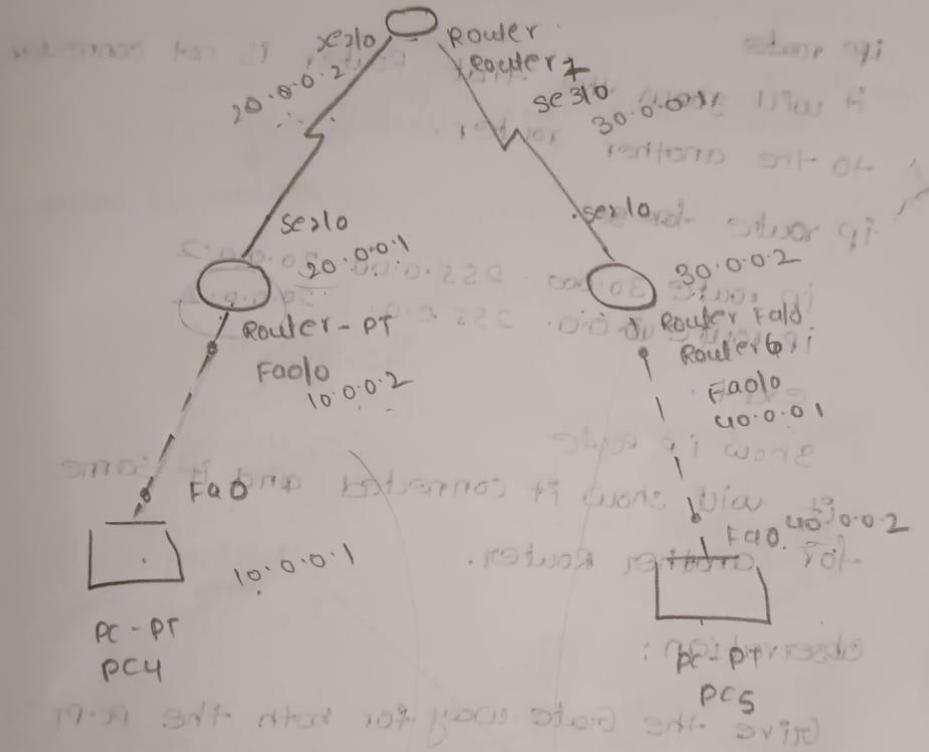

Ping statistics for 40.0.0.2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 9ms, Maximum = 21ms, Average = 13ms
```

Figure 2: ping command output

## Experiment -3

To demonstrate the configuration of default routes to the router.

## Topology:

Configuration:

③ selected the generic

To the Router-PT  $\rightarrow$  Router b Falo

# ip address route

destination network IP

destination subject most

Next hub.

this command is used  
for.

$\rightarrow$  for eaching  
the unknown  $x$

- 1) Select PC-PT and Router and connect the PC-PT and Router.
- 2) Connect the PC-PT and Router.
- 3) And go to the Router CLI and show ip route

ip routes  
It will show that Router is not connected to the another router.

ip route for se

ip route 30.0.0.0 255.0.0.0 20.0.0.2  
ip route 40.0.0.0 255.0.0.0 20.0.0.2

exit.

Show ip route.

It will show it connected and it same for another Router.

Observation:

Give the Gate-way for both the PC-PT and command prompt.

Ping 192.0.0.2

Pinging 192.0.0.2 with 32 bytes of data:

Reply from 192.0.0.2: bytes=32 time=9ms TTL=128  
Reply from 192.0.0.2: bytes=32 time=9ms TTL=128  
Reply from 192.0.0.2: bytes=32 time=9ms TTL=128  
Reply from 192.0.0.2: bytes=32 time=9ms TTL=128

### LAB WEEK 5

- a) To configure IP addresses of the host using DHCP server present within the LAN.

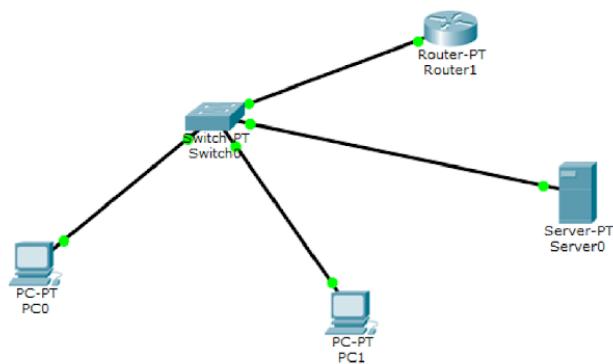

Figure 1: Topology

```
Packet Tracer PC Command Line 1.0
PC>ping 10.0.0.4

Pinging 10.0.0.4 with 32 bytes of data:
Reply from 10.0.0.4: bytes=32 time=0ms TTL=128

Ping statistics for 10.0.0.4:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0ms

PC>
```

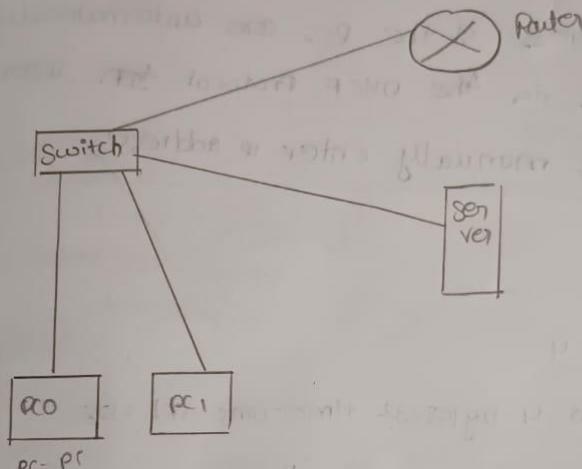

Figure 2: Output

12/11/24

### Experiment - 06

Aim: a) To configure IP address of the host using DHCP server present within the kind.

b) To configure IP address of the host using DHCP server present in the different kind.

Configuration:

1) connect to element as shown

2) to set router IP address 100.0.0.2

3) In server

ip address = 10.0.0.1

gateway = 10.0.0.2

under services go to DHCP

pool name: server pool

default gateway = 10.0.0.2

DNS server = 10.0.0.1

click on save.

u go to PC<sub>0</sub> and PC<sub>1</sub> under IP

address click on DHCP

PC<sub>0</sub> = 10.0.0.3 PC<sub>1</sub> = 10.0.0.4.

5) upon ping PC<sub>1</sub> from PC<sub>0</sub>, note is it 0% loss.

### Observation.

The IP address of the PCs are automatically generated via the DHCP protocol so user need not manually enter IP address.

Output:

↓ The main information we got know during this experiment

PC>ping 10.0.0.4

pinging 10.0.0.4: bytes=32 time=0ms TTL=128

Reply from 10.0.0.4: bytes time=2ms TTL=128

Ping statistics for 10.0.0.4:

packets: sent=4, received=4, lost=0 (0% loss),

approximate round trip times in milli-second.

minimum=0ms, maximum=2ms=2ms, Average=0ms

8/12/24

Experiment - 11

Aim: To create a virtual LAN on top of the physical LAN and enable communication b/w physical LAN and virtual LAN.

Trunk is an interface that passes messages

### Configurations:

- 1) select the 4 pc and one switch 2950T and router 1841
- 2) config Router and ip address 192.168.10.1 and the selected PC give the IP address 192.168.10.2 and 192.168.10.3 and give the gateway.
- 3) go to switch  $\rightarrow$  fan database  $\rightarrow$  VLAN 1  $\rightarrow$  add
- 4) go to Fa0/5

Change access  
Select VLAN 2  
Go to Fa0/3  
Only select

- 5) set IP address
- 6) go to route enter 4
- 7) set IP address then exit

8) type:  
VLAN database  
 $\rightarrow$  VLAN 1  
9) enter  
Type

~~12~~  
3/12/24  
11) again

- 12) type  
IP address  
no shield  
exit
  - 13) ping
- Observation:  
Success  
Physical

the physical  
and virtual LAN

sages

Change access to trunk

Select VLAN 20

go to Fa0/3 & Fa0/4

Only select VLAN 20.

5) set IP address and gateway for PC2 and PC3

6) go to router

enter fastethernet 0/0.1 interface

7) set IP address 192.168.20.3 255.255.255.0

8) set IP address 192.168.20.3 255.255.255.0  
then exit config mode ie config-subif. and config.

9) type:

VLAN database

→ VLAN 20 name VLAN1

10) enter config-subif mode.

Type:

encapsulation dot1q 20

no shutdown

exit

11) again enter interface to fastethernet 0/0.1

12) type encapsulation dot1q 20

IP address 192.168.20.3 255.255.255.0

no shutdown

exit

13) ping PC3

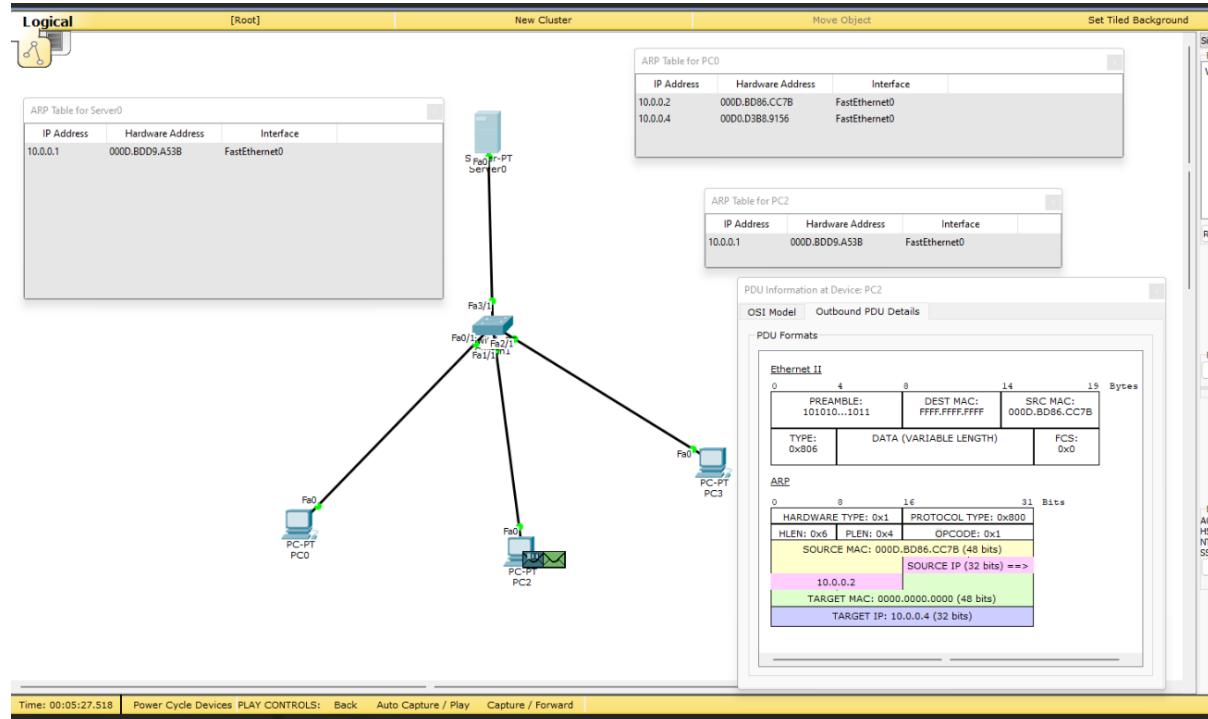

Observation:

Successful pinging within the network and between  
physical network and virtual network PC

## Program 10

### LAB WEEK 10

To Demonstrate the working of address resolution protocol(ARP) for communication within a LAN

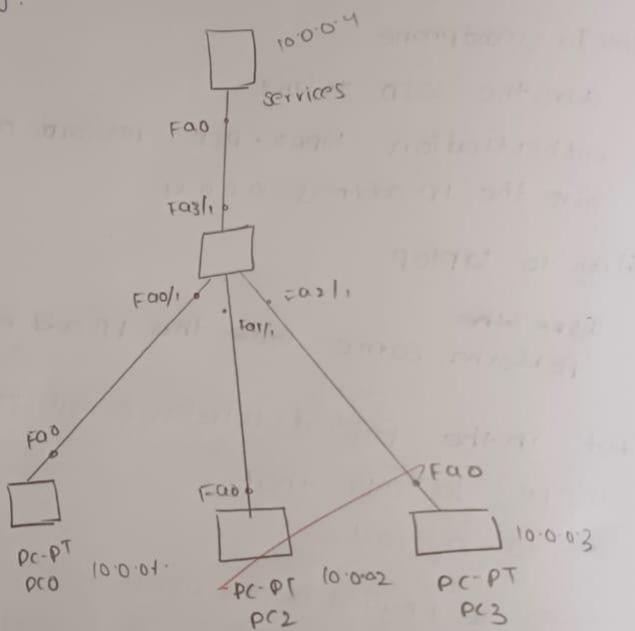

26/11/24.

### Experiment - 10

Aims: To demonstrate the working of address resolution protocol (ARP) for communication within a LAN.

Topology:

Observation configuration:

- 1) select the 3 pc and assign the ip address
- 2) one switch and services.
- 3) Give the simple PDU from PC0 to server and PC2 to services then check the ARP table.

Observation:

ARP table for Server 0.

## Program 11

17/12/2024

wrote a program for error detecting code using CRC-CRC

```
#include <stdio.h>
#include <stdint.h>
#define CRC-POLY 0X11021
#define INITIAL-CRC 0xFFFF
unit16t compute_CRC(unit8t* data, size_t length)
{
    unit16t crc = INITIAL-CRC;
    for (size_t i=0; i<length; i++)
    {
        crc ^= (data[i] << 8);
        for (size_t j=0; j<8; j++)
        {
            if (crc > 0x8000)
            {
                crc = (crc << 1) ^ CRC-POLY;
            }
            else
            {
                crc <<= 1;
            }
        }
    }
    return crc & 0xFFFF;
}
int check_CRC(unit8t* data, size_t length,
              unit16t expected_CRC)
{
    unit16t calculated_CRC = compute_CRC(data);
    if (calculated_CRC == expected_CRC)
    {
        return 1;
    }
    else
    {
        return 0;
    }
}
```

z

```
return (computed-crc == expected-crc);  
}  
}  
in main()  
{  
    unit8_t data[] = "Hello, world";  
    size_t received-length = size of (received-data);  
    if (check-crc (received-data), received-length) (rc)  
    {  
        printf ("Data received correctly with no errors.\n");  
    }  
    else  
    {  
        printf ("Error detected in received data\n");  
    }  
    return 0;  
}
```

24/12/24

Q. Using UDP sockets, write a client-server program to make client sending the file name and the server to send back the contents of the requested file if present.

Solution:

```
clientUDP.py
from socket import *
serverName = "127.0.0.1"
serverPort = 12000
clientSocket = socket(AF_INET, SOCK_DGRAM)
sentence = input("Enter file name")
clientSocket.sendto(sentence.encode("utf-8"), (serverName, serverPort))
filecontents, serverAddress = clientSocket.recvfrom(2048)
print("From server:", filecontents)
clientSocket.close()
```

server UDP.py

```
from socket import *
serverPort = 12000
serverSocket = socket(AF_INET, SOCK_DGRAM)
serverSocket.bind(("127.0.0.1", serverPort))
print("The server is ready to receive")
while True:
    sentence, clientAddress = serverSocket.recvfrom(2048)
    file = open(sentence, "r")
    l = file.read(2048)
    serverSocket.sendto(l.encode("utf-8"), clientAddress)
    print("Sent back to client", l)
    file.close()
```
